HIGHLIGHTS OF SPECIAL FRP BASE DESIGN AND UNIQUE INSTALLATION PROCEDURE

INSTALLATION PROCEDURE ENSURES THAT THE SAFELUX DOES NOT GET UPROOTED IN HIGH WINDS

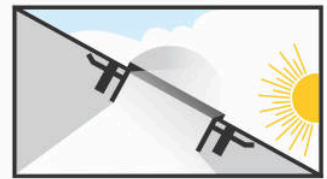

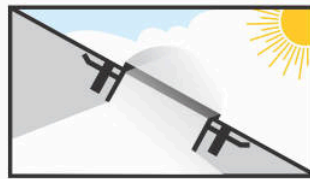

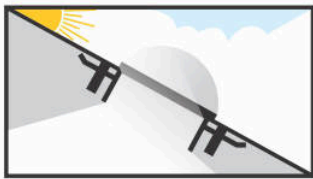

SPECIAL FRP BASE DESIGN AND INSTALLATION PROCEDURE PREVENTS ACCIDENT OF PEOPLE WORKING ON THE ROOF

LEAKPROOF INSTALLATION

SCHEMATIC SKETCH OF WORKING OF SAFELUX

COVERAGE

One SafeLux 600 mounted at a height of 20 feet can illuminate an area of 170 sq.feet with reflected sunlight up to 300 Lux. When an array of SafeLux 600 are installed throughout the shed at strategic places, the result is full illumination of the floor needing no or minimal electric lighting.

INSTALLATION

The perfect matching base sheet is installed exactly in the manner the roof sheets themselves are installed and hence does not permit water leakage thoughts its lifetime. The installation is done on the roof sheet after cutting a hole of 600mm and inserting the base sheet below the ridge cap or between two roof sheets at the joints.

MAINTENANCE

The unit is self cleaning type from the top side as the dust, tree leaves etc generally do not settle on the round dome or get swept away by the wind or the rain from time to time. The bottom side may need some attention if the workshed has smoke or dust generation or chemical processes, etc.
